Project **NV212 / Underground Test Area (UGTA)**

General Project Information

Project Description Narratives

Purpose, Scope, and Technical Approach:

The UGTA Project comprises activities to define the regional and site-specific hydrologic boundaries encompassing groundwater resources that are potentially contaminated as the result of historic underground nuclear testing activities on the NTS. The objective of the regional evaluation is to estimate current and near-term risk to workers, the public, and the environment from potential groundwater contamination downgradient from underground nuclear testing areas to determine if interim actions are needed and to provide focus and priorities for ongoing local investigations. Local investigations will focus on estimating contaminant movement and site-specific boundaries that encompass the extent of contamination from underground testing areas. Project activities are grouped into six Corrective Action Units (CAUs) which are geographically distinct, have different contaminant sources, and geologic characteristics related to their location.

The UGTA corrective action process will assess available data in each CAU to determine data sufficiency for constructing a CAU-scale flow and transport model; assess the potential for subsurface contaminant migration through modeling efforts; based on the modeling efforts, establish boundaries for groundwater that may be unsafe for domestic use; and use modeling and sampling techniques to develop and install a long-term surveillance and monitoring system. Verification of the models (Proof of Concept) is planned for five years. Closure in place is considered to be the only feasible corrective action because cost-effective groundwater technologies have not been developed to effectively remove or stabilize subsurface contaminants. The proposed remedial alternative for impacted groundwater will be design, implementation, and maintenance of a groundwater monitoring program at the NTS.

Preliminary modeling indicates that radionuclide contaminant migration beyond the NTS boundary is most likely to occur from the Western and Central Pahute Mesa areas, and early data indicates contaminants from Yucca Flat pose less of a possibility for breaching the NTS boundary. Issues regarding whether modeling and monitoring data are sufficient for predicting groundwater flow will continue to be the subject of stakeholder and regulator dialogue as results of the ongoing modeling effort and well monitoring and analysis become available. Improved equipment and techniques will be identified and utilized in order to maintain an effective and economically feasible monitoring program.

Tritium is considered to be the primary contaminant of concern over the next 100 years, in that tritium is one of the most mobile radiologic contaminants and is found in abundance. Other radionuclides will be evaluated. Improved technologies are being sought in two areas of technology need: downhole, real-time monitoring of radiation (mainly tritium) and deep-well sampling. Although no technologies are presently available to be deployed for downhole, real-time tritium monitoring, significant performance enhancement could be gained in the long-term hydrologic monitoring program through the timely deployment of such technologies as they become available.

Project Status in FY 2006:

By FY 2006, assessment will be completed for five CAUs: Frenchman Flat, Western Pahute Mesa, Yucca Flat, Central Pahute Mesa, and Climax Mine.

Post-2006 Project Scope:

Assessment of Rainier Mesa will be completed in 2007. The 5-year proof-of-concept monitoring will have been completed in all CAUs by FY 2014.

Project **NV212 / Underground Test Area (UGTA)**

Project Description Narratives

Post FY 2007 activities include sampling, reporting, and well refurbishment/maintenance throughout the duration of post-closure activities. Long term monitoring will continue in perpetuity although costs are identified through FY 2069 only.

Project End State

The end state for the UGTA Project is shot cavities closed in place; contaminant fate and transport modeling and proof-of-concept of model results completed; and a long-term environmental monitoring program established including any appropriate monitoring technology enhancements. Institutional controls including restricted access and use of groundwater will be established and maintained for the foreseeable future. Responsibility for monitoring is assumed to be transferred to the landlord, Defense Programs, after 2014.

Cost Baseline Comments:

Costs are based on the bottom-up activity-based costs estimates. Projected costs are escalated in accordance with Paths to Closure guidance. Costs include a scope contingency for wells that may be required to fill data gaps and meet regulator and stakeholder issues regarding accuracy of model predictions. Long-term surveillance and monitoring costs are assumed to continue in perpetuity, but are costed through FY 2069 only.

Safety & Health Hazards:

The hazards associated with the UGTA project are those industrial and construction hazards common to the environmental assessment and remediation industry with special emphasis upon those sites with a radiological contamination component. The use of heavy equipment is required for general construction and drilling. Projects include activities such as drilling wells and the associated construction of well pads and sumps, and road building. Workers can be expected to encounter the normal occupational/physical hazards associated with field work involving use of electrical generators and field wiring, lifting, slip, trip and fall, confined spaces, and excavations. In addition, the hazards of working in a desert environment include biological hazards and physical agents such as venomous reptiles and insects, rodents potentially infected with the Hantavirus, wild animals, heat stress and heat related injury, cold stress, and adverse weather conditions including high winds and flash floods. Radiological hazards are those associated with the on-site contaminants and include tritium, and other radionuclides associated with underground tests and experiments. Chemical hazards include those associated with both the on-site contaminants and the use of operational chemicals such as gasoline, diesel, and sampling preservatives. All activities are conducted to ensure compliance with guidance and direction provided by DOE and applicable OSHA requirements for construction and hazardous waste operations. This includes the information and procedures provided in the overall Nevada Environmental Restoration Project Health and Safety Plan (HASP) and in the site-specific health and safety plans (SSHASPs) which are unique to each field project. The SSHASP is prepared, reviewed and approved by cognizant personnel prior to the commencement of hazardous waste operations and field activities. The SSHASPs contain an integrated safety management approach to the assessment of the field-work hazards and the appropriate control and mitigation procedures. Such information includes a health and safety (H&S) risk or hazard analysis for each site task and operation, identification of key project management and H&S personnel, site exposure monitoring requirements, personal protective equipment and procedures, medical surveillance requirements, and emergency response guidance. Specialized guidance on specific hazards such as confined spaces, drill-rig safety, and excavations are included when appropriate. The procedures and guidance outlined above are applicable throughout the life cycle of the project.

Safety & Health Work Performance:

The resources necessary to accomplish the work safely are provided through the PBS, the site Health and Safety (H&S) Program requirements, and through the resources allocated to the site's integrated safety management system in the following areas: radiological safety, emergency management,

Project Baseline Summary Report

Project **NV212 / Underground Test Area (UGTA)**

Project Description Narratives

fire safety, industrial hygiene and safety, occupational medicine, security, performance oversight, and standards management. To ensure readiness prior to the start of work, Operation Readiness Reviews, hazard assessment reviews, and radiological ALARA reviews are conducted as required. The measures used to monitor the adequacy of health and safety controls include several integrated approaches. Internal and external program management reviews and audits are conducted to assess overall effectiveness and compliance. Ongoing on-site surveillance is conducted by both project management and H&S professionals to confirm work-site controls and procedures are being followed. Occupational exposure monitoring is conducted at the work sites to verify the effectiveness of contamination controls. If unforeseen H&S hazards arise that are not already covered by contingency planning, work activities are suspended until the hazard is properly addressed by management and H&S specialists. Stop Work Orders are issued if there is an imminent hazard. Formalized change control procedures are used to manage and to document major project changes.

As corrective progresses from planning to implementation to closure, resource allocations will necessarily shift. H&S resources necessary for the planning phase of a project include industrial hygienists, health physicists, safety professionals, risk assessors, quality assurance and waste management specialists, H&S and waste handling training programs, and medical surveillance. During this phase, H&S professionals ensure that the project is planned in accordance with 29 CFR 1910, 29 CFR 1926, 40 CFR, 49 CFR, and 10 CFR requirements. Resources and personnel necessary during the implementation phase include industrial hygienists, health physicists, safety professionals, waste management specialists, quality assurance programs, on-site exposure monitoring (both technicians and instruments), internal and external dosimetry programs, respiratory and noise protection programs, medical surveillance and medical emergency care programs, personal protective equipment, and engineering controls. During the closure phase of a corrective action, resources and personnel will include industrial hygienists, health physicists, safety professionals, waste management specialists, internal and external dosimetry programs, medical surveillance programs, and a record retention and management program.

PBS Comments:

Well-monitoring techniques and sample analyses are field activities that are important analytical components in the UGTA Project. Computer modeling takes into account geologic and hydrologic characteristics known and supposed to be present at the various CAU sites. This combined information provides the most accurate knowledge technologically available regarding the direction and speed of groundwater flow. At issue is whether or not contaminant boundary delineation and long-term surveillance and monitoring is sufficient for final remedial action. However, until scientific developments lead to breakthrough diagnostic and remedial methods, contamination cannot be physically removed from the groundwater, and monitoring will continue.

Baseline Validation Narrative:

The Nevada Environmental Restoration Project Baseline, which comprises the individual Project Summary Baselines for the DOE/NV environmental restoration program, has been formally reviewed by both the U.S. Army Corps of Engineers (USACE) and the DOE/HQ-sponsored Core Technical Group, and informally reviewed by the Inspector General's (IG) Office. Additionally, all cost estimates supporting the overall and individual project baselines are reviewed annually by Federal cost professionals and an independent contractor providing cost estimating support to the DOE/NV Environmental Management (EM) Program. In Fiscal Year 1997, the USACE was tasked by DOE/HQ to provide an independent assessment of site baselines in support of the remediation of contamination at DOE sites around the country. Phase I of this effort for DOE/NV was conducted in December 1996. The EM Task Force, comprised of both USACE and contractor technical experts, assessed DOE/NV Environmental Restoration Project work scopes, schedules, and cost estimates. The team concluded that scopes of work, schedules, and cost estimates for the DOE/NV EM Program were well-defined and usually supported by reliable and traceable data containing a combination of activity-based and level-of-effort costs. In July 1997, DOE/NV requested an independent Critical Analysis Review of the site's revised Nevada Environmental Restoration Project baseline by

Project Description Narratives

the DOE/HQ Core Technical Group. The team reviewed elements of scope, schedule, costs, assumptions, and an integrated execution strategy as well as management approaches and strategies. The team concluded that the creation of an environmental restoration cost-estimating system improved project and work task scheduling efforts, and further integrated planning, cost accounting, project controls, and management systems. The team further concluded the baseline document provides credible scoping information for DOE/NV environmental restoration activities even though the majority of these activities have not yet been characterized and are in a conceptual phase of development. Other conclusions were that the "template" approach used in the near real-time electronic baseline can be easily modified to reflect more accurate project data as it becomes available. It can also be used to quickly reflect the consequences of future funding scenarios. The document reflects a high degree of stakeholder and regulator input in terms of project prioritization and presents a credible approach to project completion in accordance with 2006 Plan goals. However, the scope in the baseline is subject to numerous fiscal, regulatory, and land-use uncertainties which could impact the project completion date. Finally, the Core Technical Group concluded that these future uncertainties are well beyond the influence of the parties responsible for project execution. The Nevada Environmental Restoration Project has completed mitigation of findings and recommended corrective actions from the USACE and Core Technical Group reviews. The informal review of the baseline by the IG resulted in no findings.

Project Reconciliation

Project Completion Date Changes:

Previously Projected End Date of Project: 9/13/2014

Current Projected End Date of Project: 9/30/2070

Explanation of Project Completion Date Difference (if applicable):

The completion date for the project remains the same. The completion of CAUs from FY 2001 through FY 2026 is impacted, due to the available dollars as a result of fixed funding and constant dollar averaging.

Project Cost Estimates (in thousands of dollars)

Previously Estimated Lifecycle Cost (1997 - 2070, 1998 Dollars):	493,697	Actual 1997 Cost:	15,142	Actual 1998 Cost:	20,910
Previously Estimated Lifecycle Cost of Project (1999 - 2070, 1998 Dollars):	457,645	Inflation Adjustment (2.7% to convert 1998 to 1999 dollars):			12,356
Previously Estimated Lifecycle Cost (1999 - 2070, 1999 Dollars):	470,001

HQ ID: **0225**

Project **NV212 / Underground Test Area (UGTA)**

Technology Needs

Site Need Code: NV01-9902-03S

Site Need Name: Downhole Real Time Monitoring of Radiation (Mainly Tritium) in Boreholes

Focus Area Work Package ID: SS-01

Focus Area Work Package: Characterization, Monitoring, Modeling and Analysis

Focus Area: SCFA

Agree with Technology Link: N

Benefits (Cost, Risk Reduction, Both): Cost

Technologies

	<u>Cost Savings (in thousands of dollars)</u>	<u>Range of Estimate</u>
Long-Term Surface Barriers	158,000	
Long-Term Surface Barriers	158,000	
Long-Term Surface Barriers	158,000

01209: NVTS-10 - Rad Contaminated Groundwater (UGTA Project) Y N

Site Need Code: NV02-9902-01S

Site Need Name: Deep Well Sampling

Focus Area Work Package ID: SS-11

Focus Area Work Package: Validation, Verification, & Long-Term Monitoring of Containment & Treatment

Focus Area: SCFA

Agree with Technology Link: Y

Benefits (Cost, Risk Reduction, Both): Cost

Technologies

	<u>Cost Savings (in thousands of dollars)</u>	<u>Range of Estimate</u>
Long-Term Surface Barriers	90,000	
Long-Term Surface Barriers	90,000	
Long-Term Surface Barriers	90,000	Medium
